

PLANT GROWTH REGULATORS

The importance of plant growth regulators in plant tissue culture is well documented. *PhytoTechnology* offers a broad range of plant growth regulators specifically tested for plant cell culture. Each product is assayed for physical and chemical characteristics then is biologically tested following the criteria established for powdered media. Each auxin is tested for enhancement of callus growth and/or root initiation *in vitro*. Each cytokinin is tested for stimulation of shoot production.

PLANT GROWTH REGULATORS ARE FOR LABORATORY USE, PLANT TISSUE CULTURE MEDIA PREPARATION, AND PLANT RESEARCH PURPOSES ONLY. THEY ARE NOT FOR USE AS PLANT GROWTH REGULATORS ON DEVELOPED PLANTS.

THEY ARE NOT FOR DRUG OR HOUSEHOLD USE.

PRODUCT USE

Auxins: Auxins are generally used in plant cell culture at a concentration range of 0.01-10.0 mg/L. When added in appropriate concentrations they may regulate cell elongation, tissue swelling, cell division, formation of adventitious roots, inhibition of adventitious and axillary shoot formation, callus initiation and growth, and induction of embryogenesis.

Cytokinins: Cytokinins are generally used in plant cell culture at a concentration range of 0.1-10.0 mg/L. When added in appropriate concentrations they may regulate cell division, stimulate auxiliary and adventitious shoot proliferation, regulate differentiation, inhibit root formation, activate RNA synthesis, and stimulate protein and enzyme activity.

Gibberellins: Gibberellins are generally used to promote stem elongation, flowering, and breaking dormancy of seeds, buds, corms, and bulbs. There are over 90 forms of gibberellins, but GA₃ is the most commonly used form. Compounds like paclobutrazol and ancytidol inhibit the synthesis of gibberellins.

Abscisic Acid: Abscisic Acid (ABA) plays a role in dormancy development in embryos, buds and bulbs, and in leaf abscission.

When used in tissue culture, ABA inhibits the growth of shoots and the germination of embryos. Fluridone may inhibit ABA synthesis.

Polyamines: Polyamines are compounds that occur in high levels within plants and are used in tissue culture media at concentrations of 10-1000 mM. Polyamines may enhance regeneration of roots, shoots and embryos, delay or prevent senescence, and regulate flowering.

METHODS OF PREPARATION

To prepare a 1 mg/mL stock solution: Add 100 mg of the plant growth regulator to a 100 mL volumetric flask or other glass container. Add 3-5 mL of solvent to dissolve the powder. Once completely dissolved, bring to volume with distilled/ deionized water. Stirring the solution while adding water is recommended to keep the material in solution. Store the stock solution as recommended in the tables. One mL of the stock solution in 1 liter of medium will yield a final concentration of 1.0 mg/L of the plant growth. (See conversion tables).

Desired

Concentration		Volume of Stock	
		= Solution	
Stock Solution Concentration		Required	

STOCK SOLUTION DILUTION CHART

To use this chart:

1. Determine the final concentration of the hormone/ vitamin etc. desired in the culture medium. In column A, locate the final concentration desired under the heading corresponding to the quantity of medium you will prepare.
2. Once you have located the desired final concentration then go across the chart to column B to determine the concentration of stock solution to prepare.
3. Find the volume of stock solution to use to achieve the final desired concentration in the medium in column C.

B Concentration of Stock Solution	C Amount to use (mL)	A Concentration of Final Solution (mg/L)

PGR Class	Product Name	Product Number	Function in Plant Tissue Culture
Auxins	Indole-3-Acetic Acid	I885/I364	Adventitious root formation (high concentration)
	Indole-3-Butyric Acid	I538/I460	Adventitious shoot formation (low concentration)
	Indole-3-Butyric Acid, K-Salt	I530	Induction of somatic embryos
	α -Naphthaleneacetic Acid	N600/N605	Cell Division
	α -Naphthaleneacetic Acid, K-Salt	N610	Callus formation and growth
	2,4-D (Solutions)	D295/D301	Inhibition of axillary buds
	p-Chlorophenoxyacetic acid	C213	Inhibition of root elongation
	Picloram	P717	
	Dicamba	D159/D165	
Cytokinins	6-Benzylaminopurine	B800/B130	Adventitious shoot formation
	6-(γ , γ -Dimethylallylamo)purine (2iP)	D525/D217	Inhibition of root formation
	2iP-2HCl	D341	Promotes cell division
	Kinetin	K750/K483	Modulates callus initiation and growth
	Thidiazuron (TDZ)	T888	Stimulation of axillary bud breaking and growth
	N-(2-Chloro-4-pyridyl)-N-phenylurea	C279	Inhibition of shoot elongation
	Zeatin	Z125/Z860	Inhibition of leaf senescence
Gibberellins	Zeatin Riboside	Z899/Z875	
	Gibberellic Acid (GA ₃)	G500/G362	Stimulates shoot elongation
	GA _{4/7}	G358	Release seeds, embryos, and apical buds from dormancy, Inhibits adventitious root formation
Abscisic Acid	Abscisic Acid	A102	Stimulates bulb and tuber formation Stimulates the maturation of embryos Promotes the start of dormancy, leaf abscision
Polyamines	Putrescine Spermidine	P733 S837	Promotes adventitious root formation Promotes somatic embryogenesis Promotes shoot formation
Antimitotics	Colchicine Oryzalin Trifluralin	C226 O630 T828	Binds to the tubulin dimers during cell division thus preventing the formation of spindle fibers; this results in doubled chromosomes
Dwarfing Agents/ “Anti-GA’s”	Ancymidol CCC Paclbutrazol Trinexapac-Ethyl	A123 C207 P687 T761	Interferes with gibberellin synthesis or activity Reduces internodal elongation Promotes tuber, corm, and bulb formation

¹mg/L to μ M conversion example: 0.1 mg/L of ABA = 0.38 μ M solution.

² Recommended concentration of KOH is 1 N.

Storage:

F = Freezer (-20 to 0 C)
C = Cooler/ Refrigerator (2-6 C)
RT = Room Temperature

Sterilize by:

CA = Co-autoclave with other media components
F = Filter Sterilize (Heat labile or no heat stability information available)
CA/F = Co-autoclave with media components, however, some loss of activity may occur

The above recommendations for storage and use are for informational purposes. End user assumes the responsibility for determining proper usage of the product.
